The present invention relates to novel single exon nucleic acid probes. The present sequence is one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic actiology. The diseases of the breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative breast disease and hon-carcinoma tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                      Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The probe hybridises at high liver. (I) may be used for predicting, measuring and displaying gene stringency to a nucleic acid molecule expressed in the human adult liver. (I) may be used from human adult liver. The genes identified may be involved in genetic liver diseases such as cirrhosis, hyperliphaemia, hyperliphaemia and hypercholesterolaemia which is associated with coronary heart disease. ABSISO11-ABSISO5 represent human liver single exon nucleic acid probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         425 GCCTTGCCAGAAAGTGAATCCTTGCCCAGGTATGCCCTGGATGAAAAGTGGCTGAGTTG 366

Sequence 1, Application US/09066281B
Patent No. 6475783
GENERAL INFORMATION:
APPLICANT: LUCAS, Sophie; DE SMET, Charles; BOON-FALLEUR, Thierry
TITLE OF INVENTION: FOR TUMOR REJECTION MOLECULE CODING
TITLE OF INVENTION: FOR TUMOR REJECTION ANTIGEN PRECURSOR MAGE-C1 AND MAGE-C2
NUMBER OF SEQUENCES: 20
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       3054

```
human secreted proteins, and encode the proteins given in AAY01602 and AAY1094 to AAY12026, respectively. The proteins given represent the AAY11205 and AAY12050, respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation/differentiation activity, hemmatopoissis regulating activity, thesus growth regulating activity, hemmatopoissis regulating activity, themcatchic/demoximetric activity, anti-inflammatory activity, tumour inhibition activity or other activities. The products can be used in forensis, gene therapy and chromosom mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide into a membrane, or importing a polypeptide into
                                                                                                                                                                                                         New nucleic acids encoding human secreted proteins - obtained from cDNA libraries prepared from kidney, fetal kidney, dystrophic muscle, muscle and heart tissue

Disclosure; Page 431; 463pp; English

polymorphisms associated with inflammatory bowel diseases such as ulcerative colitis and Crohn's disease. The methods can be used to detect the presence of genetic polymorphisms associated with inflammatory bowel disease and correlating their occurrence with disease states. They may be used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a gene containing a polymorphic site described in the exemplification of the The present invention describes a method for detecting the presence of invention.

on May 22, 1998 this sequence version replaced gi:2960932.

During sequence assembly data is compared from overlapping clones.

Mere differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following assembly was confirmed by restriction digest. The following
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL, Sw:, SWISSROOT; Tr:, TEMBL, Wp:, WORMPEP; Information on the WORMPEP database can be found at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           chromosome X, constructed by the Sanger Centre Chromosome X Mapping Group. Sequencing vector: Plasmid; n/a; 100% of reads
Sequencing vector: Plasmid; n/a; 100% of reads
Chemistry: Dye-terminator Big Dye; 100% of reads
Assembly program: Phrap; version 0.960731
Consents quality: 163739 bases at least Q40
Consents quality: 16377 bases at least Q20
Insert size: 15300; agarose-fp
Insert size: 163901; aum-of-contigs
Quality coverage: 11.4 in Q20 bases; agarose-fp
Quality coverage: 10.7 in Q20 bases; sum-of-contigs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NOTE: This is a 'working draft' sequence. It currently consists of 8 contigs. The true order of the pieces is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9685: gap of 100 bp

It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SOURCE
                                                                                                                                                                                                                                                                                                                                                                                                                            ð
```

This sequence was finished as follows unless otherwise noted:
all regions were double stranded, sequenced with an alternate
chemistry, or covered by high quality data (i.e., phred quality >=
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats, all regions were covered by sequence
from more than one subclone; and the assembly was confirmed by restriction digest.

# MAPPING INFORMATION:

Mapping information for this clone was provided by Dr. John D. McPherson, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://genome.wustl.edu/gec

The RPCI-11 human BAC library was made from the blood of one male donor, as described by Osoegawa, K., Woon, P.Y., Zhao, B., Frengen, E., Tateno, M., Catanese, J.J. and de Jong, P.J. (1998) An improved approach for construction of bacterial artificial chromosome libraries. Genomics 51:1-8. The clone may be obtained either from Research Genetics, Inc. (http://www.resgen.com) or Pieter de Jong (http://bacpac.med.buffalo.edu)

The clone sequenced to the right is RPI1-478M12, 200 base pair overlap. Actual start of this clone is at base position 1 of RPI1-459X11; actual end is at base position 174218 of RPI1-459X11. NEIGHBORING SEQUENCE INFORMATION:

It currently consists of 14 concigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TITLE
```

```
The sequence in this assembly is a combination of BAC based reads and whole genome shorgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.ed/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence enals will be indicated in the feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a 'working draft' sequence. It currently
consists of 3 contigs. The true order of the pieces
is not known and their order in this sequence record is
arbitrary. Gaps between the contigs are represented as
runs of N, but the exact sizes of the gaps are unknown.
This record will be updated with the finished sequence
as soon as it is available and the accession number will
be preserved.

```

```
Submitted (19-MAY-2003) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA
On May 9, 2003 this sequence version replaced gi:24940774.
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgac.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold', individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome table.
Submitted (16-SEP-2001) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Paylor Plata, Houston, TX 77030, USA 3 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263262) 1 (bases 1 to 263622) 1 (bases 1 to 263622) 1 (bases 1 to 263622) 1 (bases 1 to 263622) 1 (bases 1 to 263622) 1 (base
